

CUEING MECHANISM THAT INDICATES A DISPLAY IS ABLE TO BE SCROLLED

ABSTRACT

A method for indicating that a content page is scrollable can include the step of displaying a content page within a display area. A determination can be made that at least a portion of the displayed content page is scrollable. Responsive to the determination, a flyover can be displayed to indicate that the content page is scrollable, where the flyover can be a graphical user interface (GUI) object independent of the content page. The flyover can be a fixed object that appears on top of other windows in the GUI.
